Method 2. To reduce a fraction to lowest terms (also called its simplest form), just divide both the numerator and denominator by the Greatest Common Factor (GCF or GCD). For example, $2/3$ is in lowest form, but $4/6$ is not in lowest form (the GCD of 4 and 6 is 2) and $4/6$ can be expressed as $2/3$.

An equation involving x and y , which is also a function, can be written in the form $y =$ "some expression involving x "; that is, $y = f(x)$. This last expression is read as " y equals f of x " and means that y is a function of x . This concept also may be thought of as a machine into which inputs are fed and from which outputs are expelled.

The formula for the area of a circle is an example of a polynomial function. The general form for such functions is $P(x) = a_0 + a_1 x + a_2 x^2 + \dots + a_n x^n$, where the coefficients ($a_0, a_1, a_2, \dots, a_n$) are given, x can be any real number, and all the powers of x are counting numbers (1, 2, 3, ...). (When the powers of x can be any real number, the result is known as an algebraic function.)

In this section we will formally define relations and functions. We also give a “working definition” of a function to help understand just what a function is. We introduce function notation and work several examples illustrating how it works. We also define the domain and range of a function. In addition, we introduce piecewise functions in this section.
