Basin and range topography is an alternating landscape of parallel mountain ranges and valleys. It is a result of crustal extension/stretching (extensional tectonics) of the lithosphere (crust and upper mantle) due to mantle upwelling, gravitational collapse, crustal thickening, or relaxation of confining stresses. Crustal extension causes the thinning and deformation of the upper crust in an ...

Basin and range topography - Wikipedia

The Basin and Range province is a vast physiographic region covering much of the inland Western United States and northwestern Mexico. It is defined by unique basin and range topography, characterized by abrupt changes in elevation, alternating between narrow faulted mountain chains and flat arid valleys or basins. The physiography of the province is the result of tectonic extension that began ...

The first of John McPhee's works in his series on geology and geologists, "Basin and Range" is a book of journeys through ancient terrains, always in juxtaposition with travels in the modern world--a history of vanished landscapes, enhanced by the histories of people who bring them to light. The title refers to the physiographic province of the United States that reaches from eastern Utah to ...

The Basin and Range is a singular geologic province that covers a large portion of the southwest United States and western Mexico. It is probably the best modern example of a wide rift; a continental divergent boundary where the deformation is spread out. Unlike typical (narrow) rifts, like the East African Rift, where the normal faulting due to tensional stresses related to rifting creates a ...

San Andreas Fault and Basin and Range - Historical Geology

In geology, a basin is defined as a bounded area where the rock within the boundaries dips inward toward the center.By contrast, a range is a single line of mountains or hills forming a connected chain of land higher than the surrounding area. When combined, the two make up basin and range topography.

The Basin and Range Province is a vast geographic region in the west United States and northwest Mexico. Its topography has abrupt changes in height. It has narrow faulted mountain chains and flat arid valleys or basins. There are many ecoregions, but the lower part is mostly desert. The physical geography (physiography) of the province was caused by extension and thinning of the lithosphere ...

The Basin and Range province is familiar to anyone lucky enough to venture across it. Steep climbs up mountain ranges alternated with long treks across flat basins. This pattern extends from eastern California to central Utah and from southern Idaho to the state of Sonora in Mexico. Within the province, the Earth's crust (and upper mantle) has been stretched up to 100% of its original width ...

How do basin and range mountains and valleys form? The basins (valleys) and ranges (mountains) are being created by ongoing tension in the region, pulling in an east-west direction. Over most of the last 30 million years, movement of hot mantle beneath the region caused the surface to dome up and then partially collapse under its own weight, as it pulled apart. If it continues to pull apart ...

Basin and Range The poles of the earth have wandered. The equator has apparently moved. The continents, perched on their plates, are thought to have been carried so very far and to be going in so many directions that it seems an act of almost pure hubris to assert that some landmark of our world is fixed at 73 degrees 57 minutes and 53 seconds west longitude and 40 degrees 51 minutes and 14 ...
