Cross-sections are two-dimensional, axial views of gross anatomical structures seen in transverse planes. They are obtained by taking imaginary slices perpendicular to the main axis of organs, vessels, nerves, bones, soft tissue, or even the entire human body.

Cross sectional anatomy | Kenhub

When first encountering a cross-sectional image, whether a cadaveric specimen or a CT scan, first identify the general body region from which the image is derived, i.e. head, thorax, etc. The body region is usually readily evident based on the shape and size of the cross-section coupled to readily identifiable region-specific structures such as the brain, lungs, etc.
