Offered by Korea Advanced Institute of Science and Technology(KAIST). In this introductory course on Ordinary Differential Equations, we first provide basic terminologies on the theory of differential equations and then proceed to methods of solving various types of ordinary differential equations. We handle first order differential equations and then second order linear differential equations. We also discuss some related concrete mathematical modeling problems, which can be handled by the ...

Course Description. Differential Equations are the language in which the laws of nature are expressed. Understanding properties of solutions of differential equations is fundamental to much of contemporary science and engineering. Ordinary differential equations (ODE's) deal with functions of one variable, which can often be thought of as time.

Differential Equations. A Differential Equation is a n equation with a function and one or more of its derivatives:. Example: an equation with the function y and its derivative dy dx . Solving. We solve it when we discover the function y (or set of functions y).. There are many "tricks" to solving Differential Equations (if they can be solved!).But first: why?

Introductory Differential Equations introduces and discusses the topics covered in a typical first undergraduate course in ordinary differential equations. Throughout, we indicate how technologies such as computer algebra systems can be used to enhance the study of differential equations, not only by eliminating some of the computational difficulties that arise in the study of differential equations but also by overcoming some of the visual limitations associated with the solutions of ...

During the course we will study the fundamental properties of the main types of partial differential equations (hyperbolic, elliptic and parabolic) and discuss the various strategies available to obtain, when possible, solutions to the equations and to understand the properties of the equations. As the course is intended to be an introductory one, we restrict attention to so-called linear equations in two variables.

In mathematics, a differential equation is an equation that relates one or more functions and their derivatives. In applications, the functions generally represent physical quantities, the derivatives represent their rates of change, and the differential equation defines a relationship between the two.
