In mathematics, particularly in functional analysis, a projection-valued measure is a function defined on certain subsets of a fixed set and whose values are self-adjoint projections on a fixed Hilbert space.

Projection-valued measures are formally similar to real-valued measures, except

# Download Free Operator Valued Measures And

that their values are self-adjoint  
projections rather than real numbers. As  
in the case of ordinary measures, it is  
possible to integrate complex-valued  
functions with respect to a PVM; the result  
of such an int

Projection-valued measure - Wikipedia

# Download Free Operator Valued Measures And

What I read about is that you can integrate vector valued functions with respect to a scalar valued measure (Bochner integral or Pettis integral), or scalar valued functions with respect to a spectral resolution (projection valued measure), which is the core of the spectral theorem.

definition of operator valued integral with spectral measure

There, they work on a Hilbert space  $H$  and on the bounded operators algebra  $B(H)$  using some operator valued integrals similar to  $\int R A(x) d E(x)$  and  $\int R d E(x) A(x)$ , where  $E$  is the spectral resolution
