Abstract. The "bryophytes" comprise three phyla of plants united by a similar haploid-dominant life cycle and unbranched sporophytes bearing one sporangium: the liverworts (Marchantiophyta), mosses (Bryophyta), and hornworts (Anthoceroophyta). Combined, these

Bryophytes are the mosses, liverworts and hornworts, together comprising three of the four living groups of land plants (the fourth being tracheophytes, the large group that includes all of the familiar flowering plants, conifers and ferns). These frequently overlooked

Bryophytes - Plant Diversity (BOT317)

Bryophytes are an informal group consisting of three divisions of non-vascular land plants (embryophytes): the liverworts, hornworts and mosses. They are characteristically limited in size and prefer moist habitats although

They can survive in drier environments.  
The bryophytes consist of about  
20,000 plant species.
