Macro-social marketing is an approach to solving wicked problems. Wicked problems include obesity, environmental degradation, smoking cessation, fast fashion, gambling, and drug and alcohol abuse. As such, wicked problems are those problems that are so complex and multifaceted, it is difficult to define the exact problem, its contributing factors, and paths to a solution. Increasingly, governments, NGOs, and community groups are seeking to solve these types of problems. In doing so, the issues with pursuing macro-level change are beginning to emerge. Issues stem from the interconnected nature of stakeholders involved with a wicked problem—where one change

may create a negative ripple effect of both intended and unintended consequences. Macro-social marketing, then, provides a holistic and systemic approach to both studying and solving wicked problems. Within the chapters of this book, macro-social marketing approaches to analysing and defining wicked problems, to identifying stakeholders and potential ripple effects, and to implementing macro-level change are presented. In this emerging area of academia, the theories, models, and approaches outlined in this book are cutting edge and provide a critical approach from top researchers in the area. Both practical and theoretical aspects are presented as well as caveats on such societal and/or country-wide change. A must-have for social marketing academics and those interested in macro-level change at a practical or theoretical level.

In the years following her role as the lead author of the international bestseller, *Limits to Growth*—the first book to show the consequences of unchecked growth on a finite planet—Donella Meadows remained a pioneer of environmental and social analysis until her untimely death in 2001. *Thinking in Systems*, is a concise and crucial book offering insight for problem solving on scales ranging from the

personal to the global. Edited by the Sustainability Institute's Diana Wright, this essential primer brings systems thinking out of the realm of computers and equations and into the tangible world, showing readers how to develop the systems-thinking skills that thought leaders across the globe consider critical for 21st-century life. Some of the biggest problems facing the world—war, hunger, poverty, and environmental degradation—are essentially system failures. They cannot be solved by fixing one piece in isolation from the others, because even seemingly minor details have enormous power to undermine the best efforts of too-narrow thinking. While readers will learn the conceptual tools and methods of systems thinking, the heart of the book is grander than methodology. Donella Meadows was known as much for nurturing positive outcomes as she was for delving into the science behind global dilemmas. She reminds readers to pay attention to what is important, not just what is quantifiable, to stay humble, and to stay a learner. In a world growing ever more complicated, crowded, and interdependent, *Thinking in Systems* helps readers avoid confusion and helplessness, the first step toward finding proactive and effective solutions.

This book describes the processes that shape organisational life and shows how managers can work together to help one another to work out their problems and develop their skills. The authors draw on their experiences of working with managers and in the group relations field.

This book discusses how systems thinking and approaches can aid management consultants in navigating the complexities of client advisory in current realities. It thereby brings to the forefront aspects of holism, flexibility and responsibility - the keys to success in today's world. Management consultants are called in to offer an independent expert view of an organisation/ a situation and are expected to address some of the most pressing problems businesses face. The client does not exist in a silo, but in a complex environment that lies at the intersection of a range of internal and external factors that are often unseen and unpredictable. The organisation itself presents an alien territory that the consultant is expected to acclimatise to within a very short period of time, and come up with solutions that "insiders" would not have been able to visualise. The book presents a range of ideas, concepts and reference cases that are relevant and topical for consultants in their daily

work. It argues that systems thinking allows holism and flexibility in management consulting - while holism is about the ability to encompass the environmental and organisational complexity, flexibility is about the ability to think creatively and adopt different approaches to accommodate this complexity. With commentaries, case studies, conceptual models and perspectives that cut across multiple industries, sectors and countries, this book is a valuable resource for academics and professionals alike. The book's inner pages and its page on Springer.com contain additional comments providing perspectives of clients, industry experts and academia.

The core belief underlying this book is that the most useful and effective models to strengthen our intelligence are system ones, developed following the logic of Systems Thinking. Such models can explore complexity, dynamics, and change, and it is the author's view that intelligence depends on the ability to construct models of this nature. The book is designed to allow the reader not only to acquire simple information on Systems Thinking but above all to gradually learn the logic and techniques that make this way of thinking an instrument for the improvement of intelligence. In order to aid the learning and practice of the Systems Thinking discipline, the author has abandoned a rigid formal language for a more discursive style. He
